

ΚΥΗΣΗ ΚΑΙ ΚΑΡΔΙΑΓΓΕΙΑΚΕΣ ΠΑΘΗΣΕΙΣ: ΠΡΟΒΛΗΜΑΤΙΣΜΟΙ  
ΜΕΣΑ ΑΠΟ ΤΗ ΔΙΑΧΕΙΡΙΣΗ ΠΕΡΙΣΤΑΤΙΚΩΝ  
***Η έγκυος με ΟΣΣ***

**Μελετίδου Μαγδαληνή**

Καρδιολόγος, Επιστημονικός Συνεργάτης Γ' Καρδιολογική Κλινική ΑΠΘ

# Case presentation

**♀, 34 yo**

Developed ***acute SOB & chest pain***, on day 4 post-partum

- No previous medical Hx
- 4 days ago: **delivery** (40w, 1<sup>st</sup> pregnancy) at district hospital
  - severe vaginal bleeding complication
  - **hypovolemic shock** ( $\downarrow$ Hb 7,5g/dl), DIC

- transfer to our tertiary hospital
- admission to **ICU**, intubation - mechanical ventilation, transfusion (4 units RBC, 5 FFP, 15 units PLT, 5gr fibrinogen), inotropes, uterotonics
- transfer to Maternity Ward on day 3

# day 4 post-partum:

- acute SOB (tachypnea, orthopnea) & chest pain
- S1S2 +mild SM
- ↓ resp. sounds, bilateral basal crackles
- BP: 128/75 mmHg

→ transferred to Cardiology CCU

2021 ESC HF Guidelines

- New onset acute HF ?

✓ **Clinical confirmation**

✓ **Cause ??**

**ACS**

- ischemic obstructive CAD

- SCAD

- coronary artery spasm

**PE**

**Takotsubo Syndrome**

**Peripartum Cardiomyopathy**

# MDCT - CTPA

No PE findings

Bilateral pleural effusion

Alveolar and perihilar infiltrations

Linear atelectases in lung parenchyma

# Coronary Angiography

# Ventriculography

# Diagnosis

- **Takotsubo cardiomyopathy**

# Management

- **O2**
- iv. **furosemide** 40mg x3
- tab. **bisoprolol** 2.5mg
- tab. **ramipril** 2.5mg
- **tinzaparin** 0.45 subc
- iv. norprolac (quinagolide) 75mg
- iv. piperacillin
- iv. metronidazole

# In the following days...

- Pt. stabilized
- LVEF improved

## Discharged after 8 days

- Furosemide 20mg OD
- Bisoprolol 2.5mg OD
- Ramipril 2.5mg OD
- Norprolac 75mg OD

CMR

2 w. FU

Takotsubo  
Cardiomyopathy

stress-induced  
cardiomyopathy

# Takotsubo Syndrome

transient apical  
ballooning

broken heart  
syndrome

- 1 - 2% of all 'troponin-positive' suspected ACS presentations
- Presentation: chest pain, ECG changes, cTn elevation, LV dysfunction

## Mechanism

SNS  
activation

catecholamine  
excess

direct and indirect  
myocardial damage

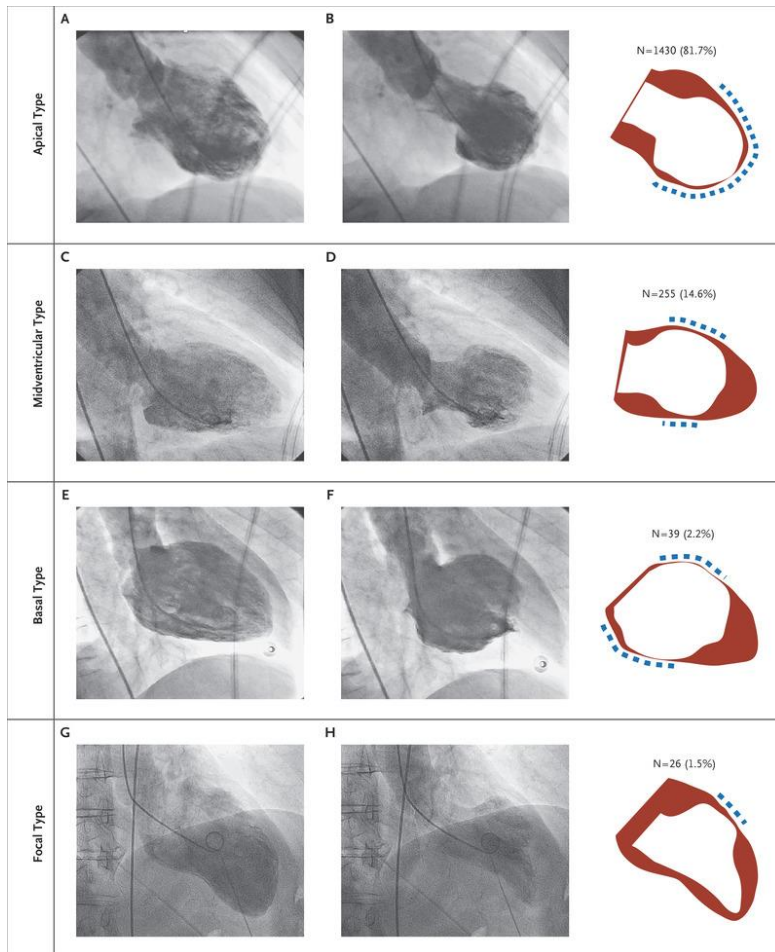

transient  
regional LV  
systolic  
dysfunction

generally  
triggered by  
emotional or  
physical stress

coronary vasospasm  
microvascular dysfunction  
acute myocardial dysfunction  
inflammation

# Takotsubo cardiomyopathy

Pattern of TCM	Prevalence in International Takotsubo Registry	Prevalence in obstetric cases studied
Apical	82%	54%
Basal*	2.2%	<b>42%</b>
Mid-ventricle	14.6%	4%
Focal	1.5%	0%

\* Also known as inverted TCM

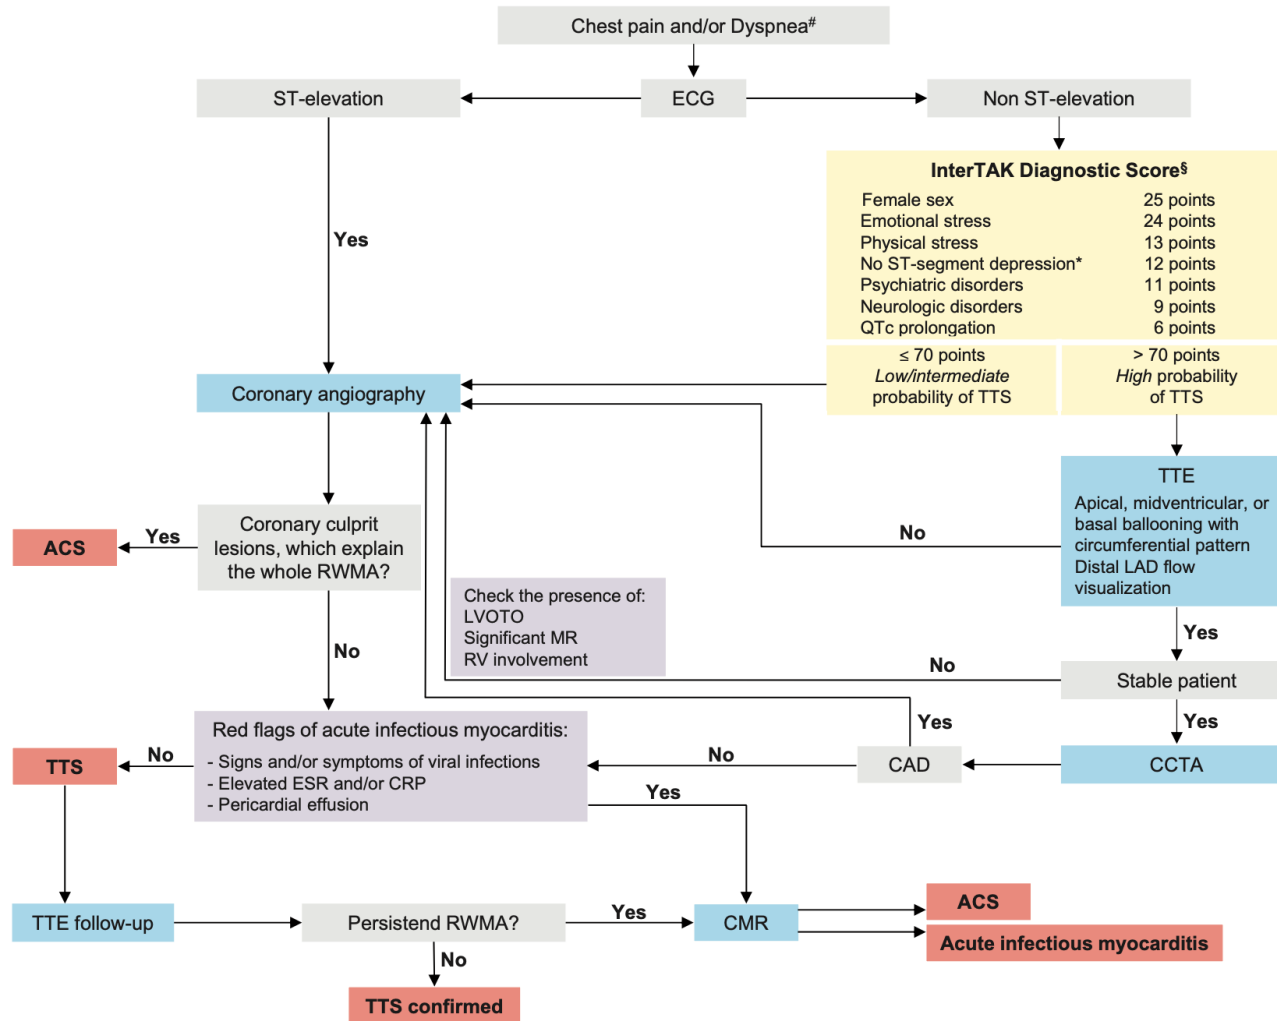

## Clinical features:

- Onset (median):

- Precipitating factor**, identified in 56% of patients, involved either exposure to extrinsic catecholamine (31%) (tocolytic agent) or events associated with high intrinsic catecholamine levels. The later included complications such as post-partum haemorrhage (PPH) (16%) and abruption, or endocrine disorder (16%).

# Diagnostic algorithm of takotsubo syndrome

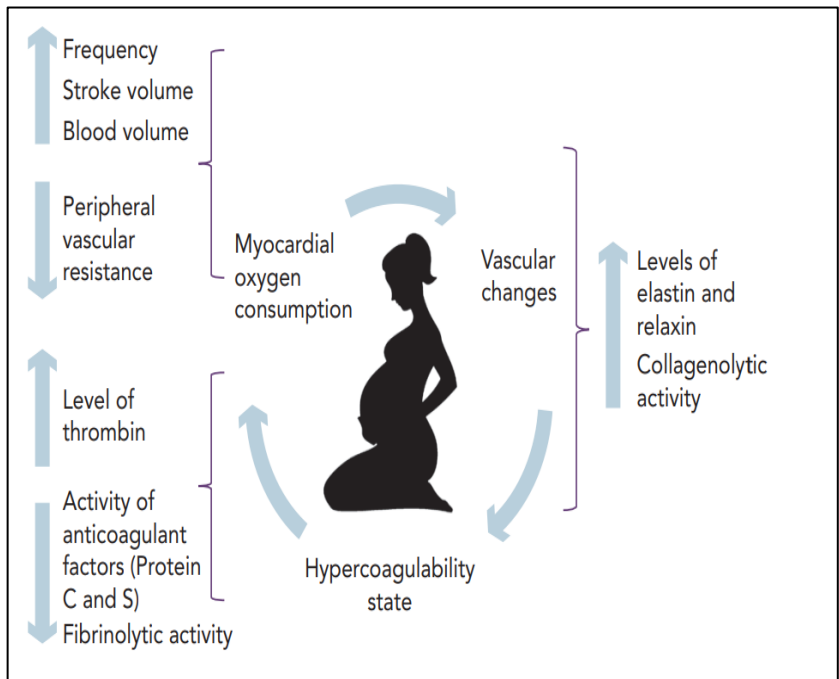

# Pregnancy, a physiologic challenge...

## Significant changes:

- ✓ hormonal
- ✓ metabolic
- ✓ hemodynamic

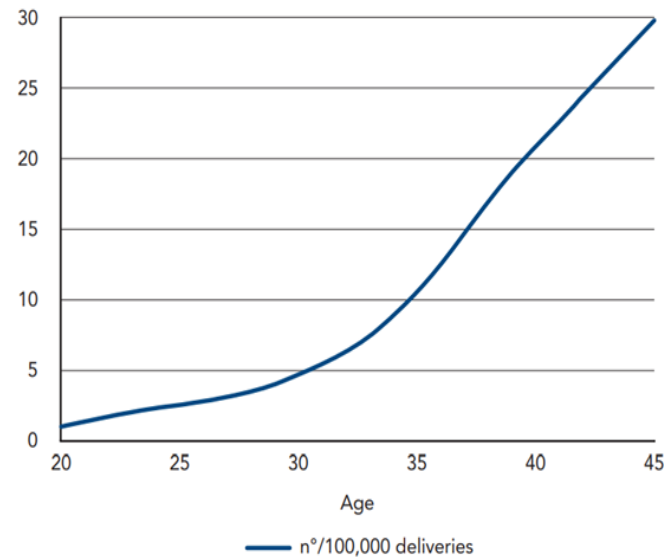

- Volume changes
- Sympathetic activation
- Pro-coagulative state
- Changes in connective tissue

# Acute myocardial infarction during pregnancy

- rare (3-10 / 100,000 pregnancies), but serious condition
- Pregnancy  $\uparrow$  3-4x risk of AMI.
- Peak incidence between the last month of gestation and the first 2 weeks post-partum

■ strongest risk factor: maternal age

- Diagnosis: similar to non-pregnant pts.

# Acute MI in pregnancy

SCAD

# Management

- No clear indication on the treatment of ACS in pregnancy is reported in current guidelines
  - Treatment should be tailored on a patient-to-patient basis

**→ To facilitate management, patients should be classified in pre- and post- partum groups**

- ❑ **Post-partum ACS group:** treatment according to the general ACS guidelines
  - only mother's health at risk
  - consider newborn lactation!
- ❑ **Pre-partum ACS group:** hampered by the presence of the foetus!!  
(risk for spontaneous abortion, bleeding and teratogenic effect)

***Two major issues should be considered:***

- 1. the interventional aspect**
- 2. the pharmacological aspect**

Both may have restrictions in different periods of pregnancy

# Invasive management

- **Coronary angiography** is the diagnostic and therapeutic gold standard, in pregnancy-associated ACS
- In patients who present with STEMI or hemodynamically unstable NSTEMI, coronary angiography should be offered regardless of pregnancy status.
- However, **fetal radiation risk** should be considered:
  - inversely related to gestational age  
(highest risk of fetal injury in <20 weeks gestational age)
  - inversely related to radiation dose  
(no evidence of fetal injury or loss in <50 mGy)

Fetal exposure:

- ✓ Chest radiograph → 0.01 mGy
- ✓ CT Chest → 0.3 mGy
- ✓ Coronary CT → 1 to 3 mGy
- ✓ Diagnostic coronary angiogram → 1.5 mGy
- ✓ Percutaneous coronary intervention → 3 mGy

# Minimizing radiation dose in pregnancy

- Radial access
- Prefer AP projections
- Minimize fluoroscopy time
- Use of low-dose fluoroscopy
- Place source as distant as possible / receiver as close as possible
- Avoid direct radiation of the abdomen
- Focus to the area of interest
- Use IVUS/ OCT
- Abdominal shielding (limited benefit)

**Ideally the mean radiation dose to the abdomen should be no more than 1.5 mGy**

# Medical management

**Table 7** Drugs and safety data

Drugs	Classification (Vaughan Williams for antiarrhythmic drugs)	Former FDA category	Placenta permeable	Transfer to breast milk (foetal dose)	Pre-clinical/clinical safety data
Abciximab	Monoclonal antibody with antiplatelet effects	C	Unknown	Unknown	Inadequate human studies <ul style="list-style-type: none"> <li>use only if potential benefit outweighs potential risk</li> </ul> Animal data: <ul style="list-style-type: none"> <li>no animal reproduction studies</li> </ul>
ACE inhibitors <sup>a</sup>	ACE inhibitor	D	Yes	Yes <sup>b</sup> (maximum of 1.6%)	Contraindicated <ul style="list-style-type: none"> <li>renal or tubular dysplasia, oligohydramnios, growth retardation, ossification disorders of skull, lung hypoplasia, contractures, large joints, anaemia, intrauterine foetal death</li> </ul>
Acenocoumarol	Vitamin K antagonist	D	Yes	Yes (no adverse effects reported)	Embryopathy (mainly first trimester), bleeding (see discussion in section 5)
Acetylsalicylic acid (low dose)	Antiplatelet drug	B	Yes	Well tolerated	No teratogenic effects <ul style="list-style-type: none"> <li>there is insufficient clinical experience regarding the use of doses between 100–500 mg/day</li> </ul>
Adenosine <sup>c</sup>	Antiarrhythmic	C	No	No	No foetal adverse effects reported (limited human data)
Alirocumab	Lipid-lowering drug (monoclonal antibody)	-	Yes	Unknown	No human data: not recommended Animal data: <ul style="list-style-type: none"> <li>no adverse effects on foetal growth or development in rats and monkeys</li> <li>maternal toxicity in rats</li> <li>weaker secondary response to antigen challenge in the offspring of monkeys</li> </ul>
Aliskiren	Renin inhibitor	D	Unknown	Yes (secreted in rat milk)	No use in first trimester; contraindicated in second and third trimesters <ul style="list-style-type: none"> <li>see other RAAS blockers</li> </ul> Animal data: <ul style="list-style-type: none"> <li>no evidence of embryofoetal toxicity or teratogenicity at doses ≤600 mg/kg/day in rats or 100 mg/kg/day in rabbits</li> <li>fertility, pre-natal development, and post-natal development were unaffected in rats at doses ≤250 mg/kg/day. The doses in rats and rabbits provided systemic exposures of 1–4× and 5× MRHD</li> </ul>

Continued

- **Thrombolysis**
  - Relative contraindication
  - Carries numerous risks (fetal and maternal hemorrhage, fetal death, preterm birth)
  - Should only be offered if coronary angiography is both indicated and unavailable
  - The risk of significant maternal bleeding after thrombolysis is especially associated with delivery
- **Aspirin**
  - ✓ Full-dose can be used up to 32 weeks gestational age
  - ✓ Low-dose can be safely used throughout pregnancy
- If **DAPT** is required, **clopidogrel** is the preferred P2Y12 inhibitor.
- **UFH and LMWH** are the preferred anticoagulants.
- **Nitrates:** can be used, but maternal hypotension should be avoided (risk of placental hypoperfusion)
- **Beta blockers:** generally safe during pregnancy, metoprolol is preferred
- **ACEi & ARB:** contraindicated
- **Statins:** contraindicated
